PROCESS CATEGORY

2010 UK FINALISTS: PROCESS CATEGORY

The category

This award is for the development and application of a new production technology that makes an outstanding contribution to sustainable development.

1. New production technology may involve an entirely new process or technique, or the innovative application of an existing one. In either case, the technology should make a positive contribution to the environmental aspect of sustainability while making at least a neutral, and preferably a positive, contribution to the economic and social aspects. Technology may be expected to increase resource efficiency and reduce life-cycle environmental impacts by saving material and energy, switching from non-renewable to renewable resources, avoiding the use of harmful substances, and reducing emissions and waste.

2. Applications for this award should represent a significant advance on what is considered to be 'best available technology or techniques' under the current EU regulatory framework.
